- Early Fusion, Late Fusion, Hybrid Fusion
- Link: <https://arxiv.org/abs/1705.09406>

For example, **for a single sample**:

XLM-RoBERTa:

- Class 0 = 0.80
- Class 1 = 0.20

ResNet50:

- Class 0 = 0.40
- Class 1 = 0.60

Then, we take the average prediction from both models:

- **Class 0** = $(0.80 + 0.40) / 2 = \mathbf{0.60}$
- **Class 1** = $(0.20 + 0.60) / 2 = \mathbf{0.40}$

Final Prediction:

- **Class 0** → **60%**
- **Class 1** → **40%**

So, the final model predicts **Class 0**, because it has the higher probability (**60%**).
